Test Results | THERMORY® Ash | Fire Rating

FIRE RATING

TESTED

- The rate of fire spread and smoke production in THERMORY® Ash.

RESULTS

- Class B was achieved, in comparison to kiln-dried Red Oak which results show to be a Class C.
TEST REPORT

FOR

THERMORY® USA, LLC
1213 Wilmette Avenue, Suite 208
Wilmette, IL 60091

Standard Test Method for
Surface Burning Characteristics of Building Materials
ASTM E84 – 12a

Test Report No: FH-2403
Assignment No: H-977
Test Date: 05/09/2013
Report Date: 05/09/2013

Subject Material: 0.79” x 5.9” T.M. Ash Decking and 1.02” x 5.7” T.M. Ash Decking

The results reported in this document apply to specific samples submitted for measurement. No responsibility is assumed for performance of any other specimen. The laboratory’s test report in no way constitutes or implies product certification, approval or endorsement by this laboratory. This report may not be reproduced, except in full, without the written approval of the laboratory.
INTRODUCTION:

This report presents the results of specimens tested in accordance with the requirements of ASTM E84-12a Standard Test Method for Surface Burning Characteristics of Building Materials. This test method is also published under the designations ANSI/UL 723, NFPA 255, and UBC 8-1(42-1).

The purpose of this test method is to determine the relative behavior of the material by observing the flame spread along the specimen. Flame spread and smoke developed index are reported. However, there is not necessarily a relationship between these two measurements.

This standard is used to measure and describe the response of materials, products, or assemblies to heat and flame under controlled laboratory conditions. It should not alone be used for fire hazard or fire risk assessment of the materials, products, or assemblies under actual fire conditions.

MATERIAL TESTED:

Material submitted by Thermory® USA, of Wilmette, IL was identified by the client as:

- "0.79" x 5.9" T.M. Ash Decking"
- "1.02" x 5.7" T.M. Ash Decking"

The material was received, in good condition, by NGC Testing Services on April 30, 2013. The material was submitted as nominally 95 in. long boards; twelve (12) boards were submitted for each sample material.

From the boards submitted, NGCTS personnel constructed (3) test specimen decks for each sample material, per ASTM Practice E2579. The specimen decks were constructed on May 8, 2013.

MOUNTING METHOD:

The specimen decks were placed end-to-end, directly on the tunnel ledges, and butted tightly together, to achieve the required 24 ft. length. No additional support was required.

Non-combustible, fiber-reinforced cement board (1/4 in. thick) was placed over the specimen decks as lid protection.
TEST RESULTS:
The test results, computed on the basis of observed flame front advance and electronic smoke density measurements are presented in the table below.

The reported flame spread and smoke developed indices, as presented below, are the computed comparison to the standard calibration materials – mineral fiber-reinforced cement board and select grade red oak flooring. The cement board is used to establish relative 0 values for flame spread and smoke developed; red oak decks are used to establish relative 100 values for flame spread and smoke developed.

* Flame Spread / Smoke Developed Index is the result (or the average of the results of multiple tests), rounded to the nearest multiple of 5. Smoke developed results in excess of 200 are rounded to the nearest multiple of 50.

| 0.79" x 5.9" T.M. Ash Decking | FLAME SPREAD INDEX | 35 |
| 1.02" x 5.7" T.M. Ash Decking | FLAME SPREAD INDEX | 35 |

| 1.02" x 5.7" T.M. Ash Decking | SMOKE DEVELOPED INDEX | 85 |

OBSERVATIONS:

0.79" x 5.9" T.M. Ash Decking: The test specimen exhibited steady ignition at 00:32 (min:sec). The flame front reached a maximum distance of 9.08 feet, achieved at 09:54 (min:sec). After the ignition flame was extinguished, the test specimen continued to flame and was manually extinguished. Once the test specimen was cooled and removed from the furnace, it was observed to have a char length of 9 feet and was discolored to 24 feet.

1.02" x 5.7" T.M. Ash Decking: The test specimen exhibited steady ignition at 00:51 (min:sec). The flame front reached a maximum distance of 11.98 feet, achieved at 09:46 (min:sec). After the ignition flame was extinguished, the test specimen briefly continued to flame before self-extinguishing. Once the test specimen was cooled and removed from the furnace, it was observed to have a char length of 10 feet and was discolored to 24 feet.
The following data sheets are actual printouts of the computerized data system which monitors the tunnel furnace. The sheets contain all calibration and specimen data needed to calculate the test results.
